

100 KSPS, 3.3 V - 5.25 V, ULTRA LOW POWER, 12-BIT SAR ANALOG-TO-DIGITAL CONVERTER

FEATURES

- 12-Bit Resolution
- Low Power (XC2360 typical):
 - 0.60mW (3.3V, 100 KSPS)
 - 0.80mW (4.0V, 100 KSPS)
- Single 3.3 V to 5.25 V Supply Operation for XC2360
- Fast Throughput Rate:
 - 100 KSPS for XC2360
- $\pm 0.5\text{LSB INL}, \pm 0.5\text{LSB DNL}$
- No Data Latency
- SPI/ MICROWIRE™ Compatible Serial Interface
- Guaranteed Operation from -40°C to 85°C
- 6-Pin SOT-23 Package
- Second-Source for LTC2360

DESCRIPTION

The XC2360 is a 12-bit, high speed, low power, and small-sized Successive-Approximation-Register (SAR) ADC. The supply current drops at lower sampling rates because the device automatically power down after conversion. The full-scale input of the XC2360 is 0V to VDD or VREF. This device can operate from a single 3.3 V to 5.25 V supply with a 100 KSPS throughput.

The XC2360 is available in a 6-pin SOT-23 package and has an operating temperature range of -40°C to 85°C .

The XC2360 is a drop-in replacement for the LTC2360 and consumes only one third dynamic power of their counterpart.

APPLICATIONS

- Communication Systems
- Data Acquisition Systems
- Handheld Portable Devices
- Uninterrupted Power Supplies
- Battery-Operated Systems
- Automotive

SPECIFICATIONS

At -40°C to 85°C, $f_{\text{SAMPLE}} = 500$ KSPS and $f_{\text{SCLK}} = 10$ MHz if $3.3 \text{ V} \leq V_{\text{DD}} \leq 5.25 \text{ V}$. (unless otherwise noted)

	f _{SAMPLE} = 100 KSPS, V _{DD} = 4 V		0.80		0.85	mW

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Figure 2. Pin Configuration

TERMINAL		DESCRIPTION
NAME	NO.	
V _{DD}	1	Power Supply Input.
GND	2	The ground return for the supply and signals.
A _{IN}	3	Analog Input. This signal can range from 0 V to V _{DD} .
SCK	4	Digital clock input. This clock directly controls the conversion and readout processes.
SDO	5	Digital data output. The output samples are clocked out of this pin on falling edges of the SCK pin.
CONV	6	Chip Select. On the falling edge of CONV, a conversion process begins.

TYPICAL CONNECTION

Figure 3 shows a typical connection diagram for the XC2360. The 3.3 V supply should come from a stable power supply such as an LDO. The supply to XC2360 should be decoupled to the ground. A 1-μF and a 10-nF decoupling capacitor are required between the V_{DD} and GND pins of the converter. Those capacitors should be placed as close as possible to the pins of the device. Always set the V_{DD} supply to be greater than or equal to the maximum input signal to avoid saturation of codes.

Figure 3. Typical Circuit Configuration

TIMING DIAGRAM

Figure 4. Timing Diagram

This is different from LTC2360 which outputs the conversion result through SDO immediately after the falling edge of the CONV. The XC2360 outputs a 12-bit conversion result from SDO after the fourth SCK falling edge after the CONV falling edge, after which the SDO enters a three-state and the conversion cycle ends. The XC2360 data word contains 3 leading zeros, followed by 12-bit data in MSB first format. Higher SCLK frequencies reduce the acquisition time and conversion time. This means the converters spend more time in auto power-down mode per conversion cycle.

CONVERSION RESULT

The XC2360 outputs 12-bit data after 3 leading zeros, respectively. These codes are in straight binary format.

DESCRIPTION	ANALOG INPUT VOLTAGE	DIGITAL OUTPUT STRAIGHT BINARY	
		BINARY CODE	HEX CODE
XC2360 (12bit)			
Least Significant Bit (LSB)	$V_{DD}/4096$		
Full Scale	$V_{DD} - 1\text{LSB}$	1111 1111 1111	FFF
Mid Scale	$V_{DD}/2$	1000 0000 0000	800
Mid Scale – 1LSB	$V_{DD}/2 - 1\text{LSB}$	0111 1111 1111	7FF
Zero	0V	0000 0000 0000	000

There is no specific initialization requirement for these converters after power-on, but the first conversion might not yield a valid result. In order to set the converter in a known state, CONV should be toggled low then high after V_{DD} has stabilized during power-on. By doing this, the converter is placed in auto power-down mode, and the serial data output (SDO) is three-stated.

OUTLINE DIMENSIONS

DETAIL "A"

NOTE:

- 1) ALL DIMENSIONS ARE IN MILLIMETERS.
- 2) PACKAGE LENGTH DOES NOT INCLUDE MOLD FLASH, PROTRUSION OR GATE BURR.
- 3) PACKAGE WIDTH DOES NOT INCLUDE INTERLEAD FLASH OR PROTRUSION.
- 4) LEAD COPLANARITY (BOTTOM OF LEADS AFTER FORMING) SHALL BE 0.10 MILLIMETERS MAX.
- 5) DRAWING CONFORMS TO JEDEC MO-178, VARIATION AB.
- 6) DRAWING IS NOT TO SCALE.
- 7) PIN 1 IS LOWER LEFT PIN WHEN READING TOP MARK FROM LEFT TO RIGHT, (SEE EXAMPLE TOP MARK)

NOTES

1. Unpacked ICs, tube-mounted ICs, etc. must be stored in a drying cabinet, and the humidity in the drying cabinet < 20% R.H.
2. After access, the components are stored in an electrostatic packaging protective bag.
3. Anti-static damage: the device is an electrostatic sensitive device, and sufficient anti-static measures should be taken during transmission, assembly and testing.
4. The user should conduct a visual inspection before use, and the bottom, side and surrounding of the circuit can be welded only if it is bright. If oxidation occurs, the circuit can be processed by means of oxidation, and the circuit must be soldered within 12 hours after processing.
